

IQ-SPS

Special weaving machines

The German company IQ-SPS GmbH, Wetztingen, is specialized in weaving technology. It produces e.g. projectile weaving machines for weaving fabrics made from polypropylene tapes. This also includes geosynthetics, which are synthetic products used for mechanical ground for stabilization where high levels of durability are required, and have a wide range of applications. Application fields are highway, civil and structural engineering, gardening, landscaping and building construction.

Further special machinery includes projectile weaving machines with a reliable weaving technology for polypropylene tape and geosynthetics weaving in a width up to 540 cm. The company builds individualized customer-specific projectile weaving machines. A modified machine is in no way an 'old' machine.

Rather, it is a machine that has been made state-of-the-art with the use of proven technology at affordable costs. The projectile weaving machines and all necessary peripheral equipment for weaving geotextiles are specified. ■
